TOOL USER MANUAL

CSV Account Splitter Guide

How the browser-based automated file grouping tool operates

> **Client-Side Privacy & Security Guarantee**
>
> This tool operates entirely inside your web browser HTML runtime. No data is transmitted to an external server or cloud service. All parsing, processing, and CSV generation occur locally on your machine.

Core Architecture & Workflow

The CSV Account Splitter takes a master tabular file, scans for the target key column, segregates records by distinct account identifiers, and triggers separate file downloads while preserving the original structure.

1. **Local File Ingestion**
   When you select a CSV file, the browser uses the native HTML5 `FileReader API` to read the raw text contents directly into system memory.

2. **Header Detection & Column Mapping**
   The script parses the first line of the document and performs a case-insensitive search to locate the exact index of the `account_name` column.

3. **Group Segmentation**
   The tool iterates over every data row, extracting the value in the `account_name` index. Records are grouped into memory buckets keyed by unique account names. Sanitization removes illegal filename characters like `\ / : * ? " < > |`.

4. **CSV Reconstruction & Staggered Export**
   For each unique account, a new CSV payload is generated by combining the original header row with that account's specific data rows. Dynamic `Blob` links trigger automated browser downloads spaced by 200ms to avoid browser pop-up suppression.

Data Transformation Example

Original Master CSV Input:

account_name	transaction_id	amount	date
Acme Corp	TXN-1001	$1,250.00	2026-09-01
Global Tech	TXN-1002	$850.50	2026-09-02

account_name	transaction_id	amount	date
Acme Corp	TXN-1003	$3,100.00	2026-09-03
Beta LLC	TXN-1004	$420.00	2026-09-04

↓ Split Engine Processing ↓

Generated Split Output Files:

📄 Acme Corp.csv

Contains full header + 2 matching rows for Acme Corp. All other columns preserved.

📄 Global Tech.csv

Contains full header + 1 matching row for Global Tech.

Key Technical Features

Quoted CSV Parsing

Correctly processes complex values containing escaped quotes, internal commas, or line breaks without breaking table alignment.

Filename Sanitization

Account names with special operating system characters are safely converted so files download cleanly on Windows, Mac, and Linux.

Missing Value Handling

Rows missing an account name or containing blank cells in the key column are automatically grouped under an `Unassigned.csv` file.

Custom Save Paths

Enable "Ask where to save each file before downloading" in your browser settings to choose custom export directories for generated files.
