Opt-Out Processor

User Guide & Tool Reference

Overview

The Opt-Out Processor is a self-contained HTML tool that runs entirely in your web browser with no internet connection required after the file is opened. It is designed to help your team clean and filter opt-out CSV exports by:

- Isolating only the email column from any uploaded CSV file.
- Removing any email addresses that appear on the embedded CE-JHN Never Opt-Out list (227 records).
- For Section 3, additionally filtering rows to only those belonging to the CE-JHN site.
- Providing a detailed activity log for every step taken during processing.
- Allowing you to rename and download the cleaned output as a CSV file.

The CE-JHN Never Opt-Out list is permanently embedded inside the HTML file itself — it does not need to be re-uploaded each time.

Getting Started

To use the tool, simply open the **optout_processor.html** file in any modern web browser (Chrome, Edge, Firefox, or Safari). No installation, no login, and no internet connection needed. All processing happens locally on your machine.

System Requirements

- A modern web browser (Chrome 90+, Edge 90+, Firefox 88+, Safari 14+).
- The HTML file saved to your local machine.
- CSV files exported from your opt-out system.

The Four Sections

The tool is divided into four independent sections. Each section processes a different type of opt-out file and can be used in any order.

Section 1 — NC Opt-Outs

Upload a CSV file containing North Carolina opt-out records. The tool will extract only the email column, remove internal duplicates, and filter out any email addresses that appear on the CE-JHN Never Opt-Out list.

Section 2 — DE Opt-Outs

Upload a CSV file containing Delaware opt-out records. Identical processing logic to Section 1: email column only, duplicates removed, Never Opt-Out list applied.

Section 3 — NC CE-JHN Opt-Outs

This section has an additional filtering step. After uploading, the tool scans for a site/acronym column (labeled siteacronym, site acronym, site_acronym, acronym, or site) and keeps only rows where that column matches the CE-JHN site pattern. It then extracts emails, removes duplicates, and removes Never Opt-Out matches. If no site column is found, a warning is shown and all rows are processed without the site filter.

Section 4 — CE-JHN Opt-Outs

Upload a CSV file containing CE-JHN opt-out records. Email column only, duplicates removed, Never Opt-Out list applied.

Step-by-Step Usage

Step 1: Open the tool

Double-click optout_processor.html, or right-click and choose Open With your preferred browser.

Step 2: Upload a CSV file

Click the upload area in the relevant section, or drag and drop a CSV file onto it. The file must be in .csv format. The tool automatically detects column names — they do not need to match exactly.

Step 3: Review the activity log

After uploading, an activity log appears showing every action taken: which email column was detected, how many rows were found, how many duplicates were removed, how many Never Opt-Out matches were removed, and the final email count.

Step 4: Review the stats bar

A color-coded stats bar summarizes the key numbers at a glance: total rows in, rows removed, and final emails out.

Step 5: Name your output file

In the filename field below the log, type a name for your output CSV. The .csv extension is added automatically.

Step 6: Download the CSV

Click the green Download CSV button. The file saves to your browser's default Downloads folder with the name you entered.

Step 7: Reset (optional)

Click Reset to clear the section and start over with a different file.

CE-JHN Site Matching (Section 3)

Section 3 uses a flexible pattern to detect CE-JHN site rows. The following values in your site column will all be recognized as a match:

```
CE-JHN
CEJHN
CE JHN
ce-jhn
ce_jhn
Ce-Jhn
ce jhn
```

The tool also auto-detects the site column name. Any of the following column headers will be recognized:

```
siteacronym
site_acronym
site acronym
site-acronym
acronym
site
```

The CE-JHN Never Opt-Out List

The Never Opt-Out list contains 227 email addresses that must never be included in any opt-out export. These are individuals who have specifically requested to remain on all communications. The list is embedded directly in the HTML file and is applied automatically in all four sections.

Email matching is case-insensitive. For example, John@Example.com and john@example.com are treated as the same address.

Reading the Activity Log

Each section displays a timestamped log after a file is processed. Log entries are color-coded to make them easy to scan:

Color	Meaning	Example
Gray (info)	A neutral step completed normally	Parsed 1,450 rows from uploaded file
Green (success)	A positive outcome or completion	Processing complete — 1,201 emails ready

Orange (warning)	Something to be aware of	No site column found; processing all rows
Red (error)	A problem that stopped processing	No email column found in uploaded file

Each log entry also shows a timestamp so you can track exactly when each step occurred during your session.

Tips & Notes

- Your CSV file does not need to have only an email column — the tool finds it automatically by looking for any column whose name contains 'email'.
- The tool is completely offline. No data is sent anywhere. Everything stays on your computer.
- Each section is independent. You can process all four in the same session or just the ones you need.
- The Download button is only enabled after a file has been successfully processed.
- If the tool cannot find an email column in your file, check that the column header contains the word 'email'. Rename it in Excel if needed before re-exporting.
- The output CSV will contain a single column header 'Email' followed by one email address per row.
